The impact of the methylation on the chromatographic properties and biological activities of some racemic indolo-(1,2,3-b)-quinolinones. Isomeric racemic indolo-quinolinones (1-4) were prepared in one step from the S-aryloxazolones (5-12) by reaction with 2-aminobenzaldehyde. The formation of 1-3 has been confirmed by the single-crystal X-ray structures of 1 and 3. The effect of methylation of indoloquinolinones 1-3 has been evaluated. Of particular interest was the loss of the potent PDE5 activity of 4 and the partial loss of that of 3. This is consistent with the hypothesis that the presence of the N1-methyl group in the latter compound sterically interferes with the binding of the quinolinone ring to the

PDE5 active site. The activity of the C8-methyl homologue 4 is still unknown. The present invention relates generally to communication systems, and, more specifically, to channel allocation schemes in wireless communication systems. In wireless communication systems, users typically have access to a single shared resource, the air interface, for all communications. In order to maximize the available capacity of a single resource, it is beneficial to utilize efficient channel allocation methods. For example, the channel allocation in downlink transmissions from a base station (BS) to a mobile station (MS) is commonly referred to as the uplink scheduling in wireless communications. Scheduling of uplink transmissions is typically done to increase a signal-to-noise ratio, SNR, of the uplink signal. One commonly used approach is the time-domain scheduling
