However, the disadvantages of N-PLGA microparticles are that the fabrication is complicated and difficult to scale up.[@CIT0061] Therefore, modifications of N-PLGA microparticles can be useful to increase the loading and drug release efficiency and to make the particles suitable for oral administration. Conclusion {#S0005} ========== Our study proved that N-PLGA microparticles can enhance the dissolution rate of aspirin and are an effective drug carrier to enhance aspirin absorption by improving dissolution. The in vitro dissolution of aspirin from the different N-PLGA microparticles was not comparable to the dissolution profile of aspirin in the acidic gastric solution. However, after gastric emptying, the concentration of aspirin is higher in the acidic gastric solution and lower in the N-PLGA microparticles. Furthermore, our results showed that the in vitro dissolution of aspirin from different N-PLGA microparticles are significantly improved with the aid of esomeprazole. This study concluded that the enhanced dissolution of aspirin from N-PLGA microparticles is due to the dissolution of N-PLGA microparticles themselves and the integrity of the PEG layer. This research, therefore, proves that aspirin-loaded N-PLGA microparticles enhance drug dissolution and the dissolution rate is enhanced by esomeprazole. Therefore, this can improve the therapeutic efficacy of this drug. Finally, in vivo investigation of the therapeutic efficacy of aspirin-loaded N-PLGA microparticles is required to establish their application in the treatment of gastritis. The stored procedure takes a varchar parameter. If the parameter is NULL, then nothing should happen. The issue is that if I set the parameter as NULL, then I get a NullReferenceException on the line that is setting the parameter in the stored procedure. This is a problem because the stored procedure relies on the parameter being set and I am getting a NullReferenceException even before calling the stored procedure. The varchar parameter is defined as follows: I call the stored procedure from within the forms application like this: Dim str As String = String.Empty Me.searchTextBox.Text = str Dim oCommand As New SqlCommand("SearchTempData", oDBConnection) oCommand.CommandType =

CommandType.StoredProcedure oCommand.Parameters.Add(New SqlParameter("@startSearchString", SqlDbType.VarChar, 500)) oCommand.Parameters("@startSearchString").Direction = ParameterDirection.Input oCommand.Parameters.Add(New SqlParameter("@endSearchString", SqlDbType.VarChar, 500)) oCommand.Parameters("@endSearchString").Direction = ParameterDirection.Input oCommand.Connection.Open() oCommand.ExecuteNonQuery() oCommand.Connection.Close() When I debug ca3bfb1094

Field of the Invention This invention relates to the field of robotics. More specifically, this invention relates to a method for detecting and/or correcting misalignment of the axes of two linked platforms. 2. Description of the Related Art Robots are becoming increasingly sophisticated, performing tasks once thought possible only for human operators. This has resulted in a shift in the design of robots from being one-purpose devices into multi-purpose devices. A multi-purpose robot may be built to perform a variety of tasks such as welding, spot welding, cutting and fabrication. However, as the variety of tasks a robot is capable of performing increases, the design of the robot becomes more complex and time consuming. Typically, a robot arm includes a number of linkages, each configured to perform a particular operation. For example, a robot arm designed to perform a particular welding operation may include an upper arm, a lower arm, a first shoulder linkage, a second shoulder linkage and a first elbow linkage. The lower arm, the first shoulder linkage, the second shoulder linkage and the first elbow linkage are interconnected by a first universal joint, the upper arm and the second shoulder linkage are interconnected by a second universal joint and the upper arm and the first elbow linkage are interconnected by a third universal joint. Most robots are designed to perform a specific function, such as welding, cutting or fabrication. For example, a welding robot is designed to perform welding operations.
