A new method of measuring dry and wet roasting times of beer brands by analyzing their volatile composition. A new method of measuring roasting times of beer brands using the analysis of their volatile composition is proposed. The method is based on the analytical results of gas chromatography/mass spectrometry (GC/MS) of 1-butanol, 1-butene, 2-pentanone, 2-nonanone, 2-ethylhexanol, and 6-methyl-5-hepten-2-one of the volatile components. Volatile compounds of roasted beer were analyzed by gas chromatography/mass spectrometry and gas chromatography/olfactometry. The results of the GC/MS analysis of volatile compounds in roasted beer were compared with those in the literature. In addition, volatile compounds of coffee and roasted coffee were analyzed by GC/MS and gas chromatography/olfactometry to verify the ability of the method. The results of the measurement of the 1-butanol content by gas chromatography/olfactometry and GC/MS showed a good correlation, but the detection limits were higher by gas chromatography/olfactometry. In this study, it was verified that the 1-butanol content of roasted coffee and roasted beer decreased as roasting time increased, and the content of these compounds correlated well with the roast times measured by the color change method.
