## AutoCAD Crack+ 2022 [New]

Purpose of AutoCAD The purpose of AutoCAD is to assist designers, draftsmen, and anyone else who works with drawings in creating technical and architectural drawings. These drawings can be in many different forms, such as simple diagrams, schematics, architectural plans, and 3-D models, but all can be described as drawings of some sort. By nature, these drawings involve geometric shapes, lines, and curves. In this section, you'll learn about the various types of drawings you can create with AutoCAD. Types of drawings created with AutoCAD There are three main types of drawings created with AutoCAD: drafting-related drawings, engineering drawings, and presentation or documentation drawings. Drafting-related drawings Drafting-related drawings are created to assist you in making technical and architectural drawings. Examples of drafting-related drawings include: Layout drawings of piping systems Engineering drawings of mechanical and electrical components Architectural drawings of buildings, rooms, and other structures To make a drafting-related drawing, you need to start with a plan, elevation, or section drawing. Engineering drawings Engineering drawings are used to describe technical and structural concepts for buildings, components, and machines. They include drawings of machinery (mechanical) and electrical systems, piping systems, and other mechanical and electrical equipment. Presentation drawings A presentation drawing is used to describe and show a model or artwork. Presentation drawings include computer-aided design (CAD) drawings of mechanical and electrical components, architectural designs, building plans, and documentation of different types of architectural models. AutoCAD's various drawing types This section describes the various drawing types that can be created with AutoCAD. Drafting-related drawings A drafting-related drawing is a drawing that describes the geometric shape of an object, such as a pipe, electrical circuit, pipe fitting, or other mechanical or electrical part. These drawings include: Layout drawings Engineering drawings Presentation drawings Drafting-related drawings are created in a digital modeling environment. You may create drafting-related drawings using the tools in the Freehand drawing tool, the Type tool, or other drawing tools. Example of a drafting-related drawing Figure 1 shows a drafting-related drawing for a piping system. Figure 1: Drafting-related drawing

The AutoCAD API for Ruby and the ArcGIS API for Ruby The ArcGIS API for Ruby is a cross-platform extension to the ArcGIS API for JavaScript, C++ and C# that provides GIS functionality. The Ruby language is more user-friendly than C++. The API is meant to be a bridge between existing GIS data and Autodesk software. This includes the ability to create custom applications that interact with Autodesk software, such as AutoCAD, to perform workflows and create custom tools. The Ruby language is also a language on its own, not dependent on C++ or the .NET environment. The Autodesk platform for ArcGIS API for Ruby (ArcGIS API for Ruby) is currently a beta product. ## AutoCAD Crack For Windows

Open a new model in Autocad. Create a shape of the floor like a rectangular shape like this. Save the file as ctp. Open that file and save it as rect.ai. Open the file rect.ai and activate it. Save it as rect. Delete the floor. Delete the rect.ai. How to convert the rectangle into a box A: If you are really looking to create a box from a rectangle, the following will do. The issue with what you have done is that your floor has been created as a collection of individual parts (left,right,top,bottom,back,front). It also creates an extra top right and bottom left parts. Select all of the front and top-right, bottom-right, and bottom-left parts. Right click > Group. Make all of the front and back parts top and bottom of the box. Make the right parts top and bottom of the box. Join the front and back and top and bottom. Extrude the right and bottom parts to create the ends of the box. If you want to be able to change the faces afterwards (e.g. change the bottom to be a full floor, or change the top to be an empty space for a window etc) then the following will work. It will create the top and bottom faces that you will be able to edit afterwards. Select the top and bottom parts and the right and left parts. Right click > Group. Make all of the top and bottom parts sides of the box. Make all of the left and right parts sides of the box. Join the top and bottom. Extrude the top and bottom parts to create the ends of the box. After you have done this you can apply a texture to the top and bottom faces using the following: Select the top and bottom parts. Right click > Apply texture > Add texture. Choose an image, and adjust the position and rotation. F.2d 1071 (7th Cir.1986); Tillett v.
