Histopathology is a diagnostic technique that has evolved from a purely visual examination of tissue, to one that now involves digital imaging of histological slides. Digital slide scanners are the latest innovation in the digital era of pathology, and offer the potential to

move beyond static light microscopy. The purpose of this review is to explore the use of new imaging techniques in surgical pathology. Surgical pathology is the cornerstone of diagnosis and treatment in cancer and has become increasingly reliant on digital microscopy. Currently available histopathology digital imaging systems allow for the use of various image capture and viewing modalities, and these modalities are being used to supplement the traditional histopathological examination. In this review we examine the evolution of digital microscopy from initial photography in the 1980s, to the development of digital scanners. We describe the advantages and disadvantages of these technologies. We conclude with an assessment of the ongoing development of these technologies, and describe areas of research to consider for future development.
