In 2017, AutoCAD Product Key was the leading CAD software worldwide, and according to a

December 2019 report by market research firm Canalys, AutoCAD was the leading CAD software market worldwide, with an estimated market share of 64.6 percent. AutoCAD is used for the creation, editing and manipulation of geometric

drawings or diagrams for various purposes, including modeling, simulation, visualization, drawing, communication, mechanical design, and documentation. It is also used for architectural and engineering purposes. List of most common shapes used in CAD Basic shapes used in computer aided design There are over 200 types of basic shapes that can be used in any type of CAD software. Shapes range in complexity from simple lines to complex polygon meshes. They may be used for creating geometric surfaces or they may be applied as a system

of primitives to generate various types of 3D objects. Line, Circle and Rectangle The simplest type of shape to create is a line. A line defines the boundary of a geometric shape. In AutoCAD, you can draw lines using the Line tool. To draw a line, select the Line tool from the Tools pull-down menu, and then draw. You can also change the line's thickness using the Line Thickness pull-down menu, or you can change its color using the Line Color menu. To create a circle, you can select the Circle tool from the Tools pull-down menu, and draw. You can also

change the circle's diameter using the Circle Size pull-down menu. To create a rectangle, select the Rectangle tool from the Tools pull-down menu, and draw. You can change the width and height of the rectangle using the Rectangle Height and Width pull-down menus. To create a curved rectangle, you can select the Rectangle tool from the Tools pull-down menu, and draw. You can change the width and height of the rectangle using the Rectangle Height and Width pull-down menus. You can also adjust the corner radius using the Curved Rectangle pull-down

menu. Dotted, dashed and dotted-dashed lines To draw a dotted line, select the Dotted tool from the Tools pull-down menu, and draw. You can adjust the line's thickness using the Dotted Thickness pull-down menu. You can also change the line's color using the Dotted Color pull-down menu. To draw a dashed line, select the D

The creation and import of DXF files into AutoCAD is done using "direct DXF import". DXF can contain drawings and the

specific type of drawing and a DXF specification can be created for each drawing, if needed.

AutoCAD is bundled with AutoLISP. AutoLISP allows for the creation of custom macros or scripts that can be run asynchronously with AutoCAD to automate various operations.

The scripts can be user written in the AutoLISP scripting language or the programmer may opt to use the included set of library routines to automate more complex operations. Applications

Add controls for automatically merging adjacent pads (rather than stacking them). Draw horizontal and vertical lines to orient components. Add control nodes to make axis-based marks. Add control nodes to make marks using control points in the drawing, and manage two

axes at once. Choose whether you want model drawing control over the pad layout. Choose from two grid options for each layout, including grid lines that follow any drawn line. Save and restore pad configurations.

Annotation: Create and maintain annotations on your drawings. Annotations in AutoCAD are different from the Draw Overlay feature that you find in other software. Draw Overlay and annotations are two separate tools with different uses and different functions. (video: 1:20 min.) Integrate external tools. Update annotations from other

programs, even when you have not opened your drawing. Send annotations directly to other programs. Add text to a drawing, no matter where the drawing is saved. Improvements in Review and Modify tools: Revert edits to a previous state. Work across grid layouts when modifying drawing objects. Work seamlessly across multiple regions of a drawing. Prevent inadvertent changes when you select an individual object. Reduce the number of drawing steps required to undo/redo. Review and modify objects with a single tool, regardless of the

tool you're using. New Layered Editing Create a new layer on a drawing for a special type of drawing. Each layer will display a unique drawing style. Layers are created as empty drawing layers, just like any other layer type, such as linetype or linewidth. When you create a new layer, you can automatically apply a linetype or linewidth style. You can also apply a linetype or linewidth style that you've already created. You can also apply a linetype or linewidth style to multiple layers at once. Use the Apply Layer Style menu command to

apply a linetype or linewidth style to a layer. (video: 1:40 min.) Use the Apply Layer Style command to apply an existing linetype or linewidth style to a drawing. (video: 1:48 min.) To preview and apply an existing
