DESO\_Ordinary\_Chemistry\_Qs.Marsdenia longifolia Marsdenia longifolia is a woody, erect shrub or small tree that grows in a wide range of habitats in many countries in Africa, Indo-China, eastern Australia and Pacific Islands. The Latin specific epithet longifolia means "longleaved", referring to the long petiolate, spathulate, sericeous, glabrous (hairless) leaves of M. longifolia, Subspecies Marsdenia longifolia subsp. longifolia Marsdenia longifolia subsp. papillata (Hawkes) Schelpe Description Marsdenia longifolia is a shrub or small tree growing to tall. Its stems are usually slender and straight, but may be angled, crooked, spiny or angled. The leaves have a soft grey-green lamina, about long and lanceolate, rounded at the apex, with parallel sides and a blunt, fine apex. The pale-coloured petioles are glabrous except for a minute fringe of short yellow hairs. The flowers, which lack petals, have two to four yellow stamens arranged in a tube; the upper part of the tube forms a hood. Flowering occurs from December to May (June in Western Australia) but may be without flowers until October. The fruit, which is a berry with a double stone, is round, about in diameter, grey with bluish streaks. Taxonomy The species was first formally described in 1818 by the German botanist Johann Reinhold von Donner in the book Prodromus Florae Novae Hollandiae et Insulae Van Diemen. Cultivation Marsdenia longifolia is cultivated as a garden plant for its attractive berries. Distribution and habitat Marsdenia longifolia occurs from Australia and Southeast Asia to New Zealand and Fiji. Its natural habitat is forests and woodlands in dry areas. In Australia, it is common in dry sclerophyll forests and open woodlands in the north and northwest of Western Australia, the Northern Territory and the Kimber

However, the process was both time-consuming and labour-intensive, as it required intricate human intervention, he said. Dr Curtis also tackled that problem by developing automated systems " " "This latest breakthrough is extremely exciting," he

said. "So far, organ replacement has mostly involved transplanting organs from one person to another, but we can now grow our own human cells in the lab, to fabricate replacements which would be a great improvement on the current options." "Now I'm going to go get hammered. \* Currently, there is no legislation governing the use of new medicinal products and their availability for purchase by consumers in the Republic of Belarus. As such, any sale by the distributor is in this case subject to agreements between the distributor and the producer. This is the case in particular for the supply of medicinal products within special programs (e.g. Cooperative Medicines Program) and for consumer help programmes. \*\* Currently, there is no legislation regarding the use of new medicinal
