\*\*hug the taste of terror & see it shattered by a songwriting wizard, a woman in a bar, a hipster, a seeker, and many more.\*\* \*\*araspits\*\* - She is the creator of [www.biddynation.com](http://www.biddynation.com) and is a successful freelance copywriter, writer, blogger and copy editor. Her work has been featured in the Huffington Post, World of Dance and Hasbro's My Generation. Many factors must be considered when assessing the validity of a currency (or monetary system) design. One of the most critical issues is known as the "stability and stability" of the currency. In the long term there is a rule of thumb known as the law of supply and demand. This rule of thumb states that the currency will become more valuable over time, as the currency is scarce relative to the currency's demand. However, this is not a sufficient condition for a currency to be stable, as for example, modern popular currencies such as US dollars or British Pound Sterling, have not followed this rule, and have lost market share and inflation to other currencies. Many economists, such as John Law, have concluded that the long term-value of currency is determined by the public appetite for the currency, and not simply by public demand for the currency (where that is related to the supply). If the public appetite for the currency is high, then the currency will be stable. However, in the short-term, economic conditions, such as inflation, may cause price levels to rise over time, and hence affect demand for the currency. Many currencies are therefore designed to be stable and become less stable over time. A key issue is that governments, central banks and other governmental authorities have a need to pay their debts with currency. The value of the currency is fixed by the government and is related to the value of the currency relative to other currencies. There are some people that believe that the government should use the full powers that they have over the supply of currency to fix its value. That is, to make sure that the currency is stable. Such people say that it is the role of the government to control the supply of currency, so that the currency can be stable. They also say that the government should make the currency go into hyperinflation, or even create a new currency. However, the government has very limited control over the supply of currency. They can only control the amount of currency that they issue in the government's currency system
