Introduction To Managerial Accounting Philippines Edition Editura Francisco Jimenez Cs F. Jimenez AdscivirQ: Can I use Twilio API to generate custom SMS? I am building an API that will be able to send SMS to my mobile app users. Which is the best way to go, given that I don't want to generate the SMS with the users device, and I want to keep things as simple as possible? - using API - using REST client, and generating the message server side - using REST client, but generating the message locally - other? A: This is about achieving the best performance from your SMS. To get the most performance, you need to send SMS via API. If you use REST clients, you will slow your SMS process. You'll be able to send SMS using REST clients with XXXXX (X being number), followed by 10-15 digit short code. Usually you can send many SMS per second. If you send more SMS per second, You'll end with a SMS rate-limitation. See: TWILIO REST API | Tutorial 1. Field of the Invention The present invention relates to the field of display, and more particularly to a backlight module and a liquid crystal display. 2. The Related Arts Liquid crystal display is a flat panel display device, which possesses the advantages of low radiation, low power consumption and low electromagnetic interference (EMI). Thus, liquid crystal display has been widely used in consumer electronics products, such as liquid crystal TV, cellular phone, personal digital assistant, liquid crystal monitor, notebook, etc. A liquid crystal display generally comprises a liquid crystal display panel and a backlight module. A conventional liquid crystal display panel is composed of a color filter (CF) substrate, a thin-film transistor (TFT) substrate and a liquid crystal layer interposed between the two substrates. The operation principle is that liquid crystal molecules of the liquid crystal layer are driven by an electric field and the light transmittance of the liquid crystal molecules can be controlled by applying the electric field to control light to pass through the liquid crystal layer. Generally, a cold cathode fluorescent lamp (CCFL) is frequently used as a backlight source of a liquid crystal display in liquid crystal display panel. However, since a CCFL has high power consumption and low color purity, an LED (light emitting diode) has been developed as a backlight 6d1f23a050
